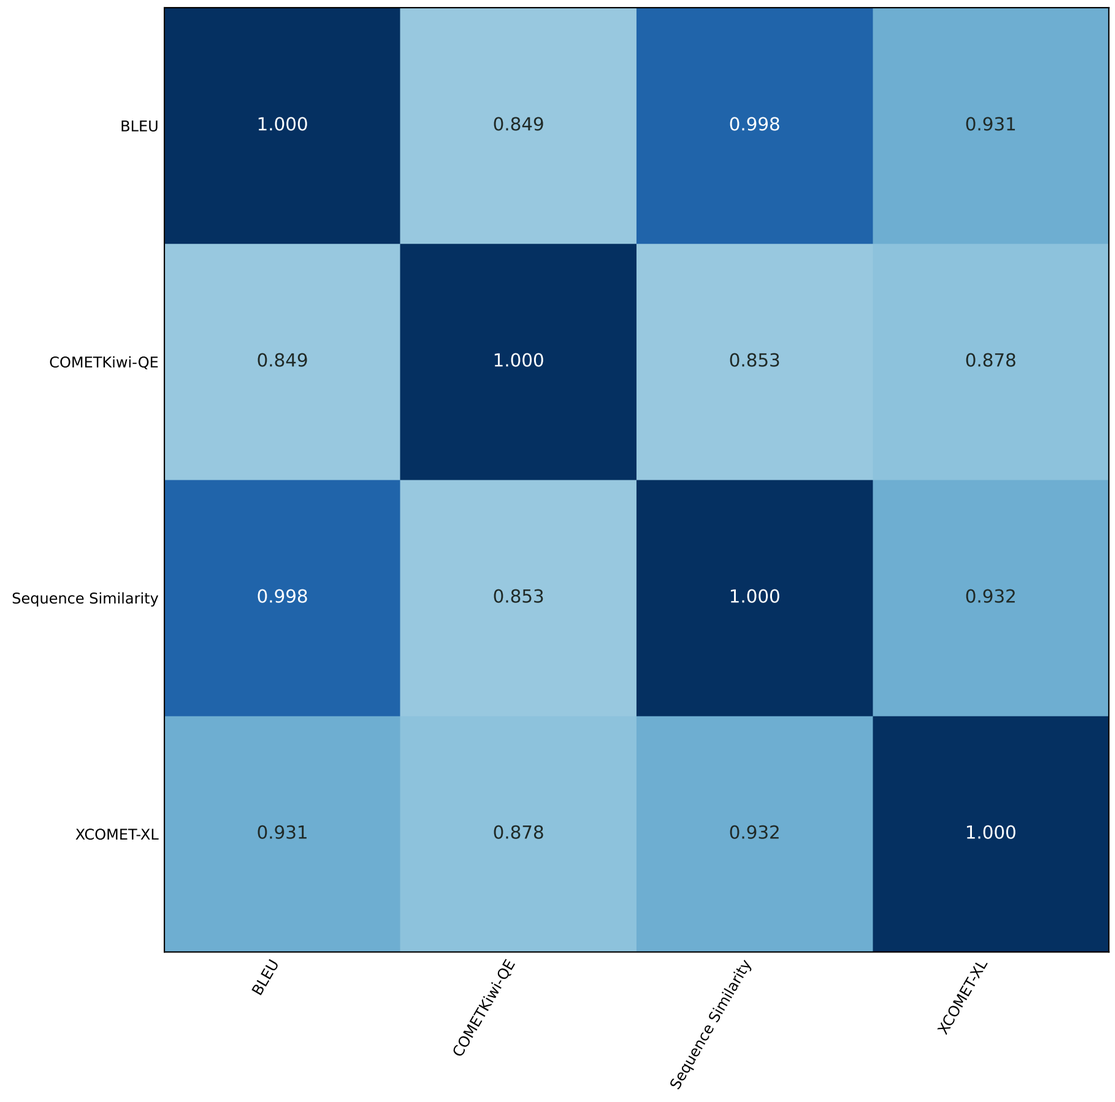
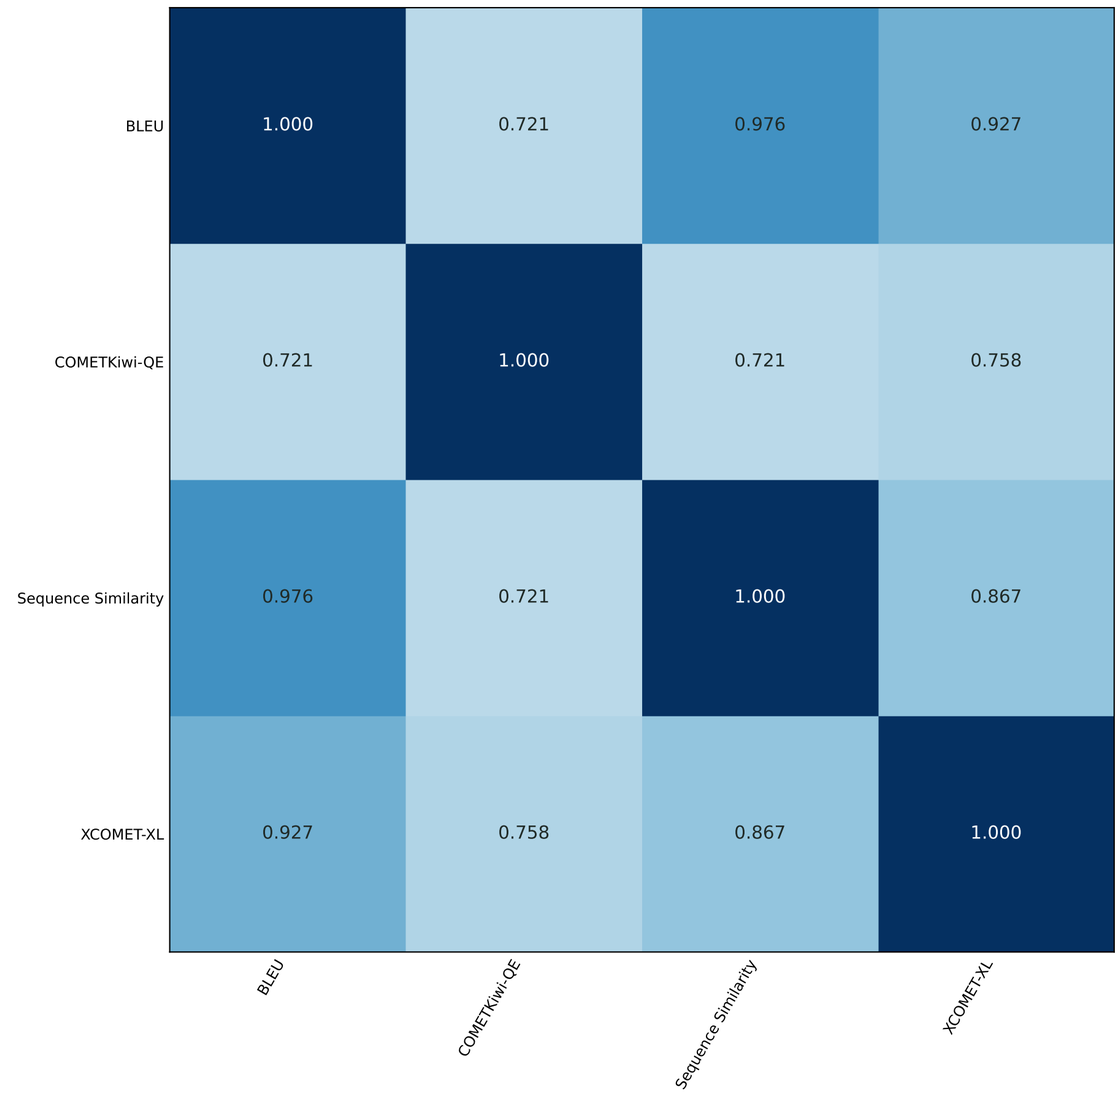
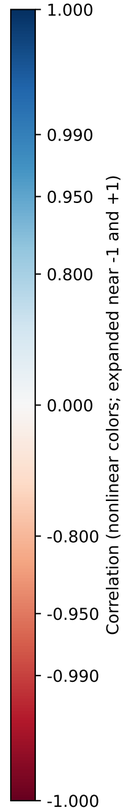
Four Selected Metrics | All Three Datasets (Equal Weight) | original_glm | Few Shot







Four distinct metrics minimizing mean absolute Pearson/Spearman correlation across both prompts and annotation views; no metric-family coverage constraint.

All datasets: one point per model, equally averaging three dataset direction-macros; 10 models, NOT 30 pooled model/dataset points.

Cells: unchanged coefficients to three decimals. Colors use a shared nonlinear scale to expand differences near +/-1; colorbar ticks are actual correlations.

Each pair uses common directions within each dataset across all models, both prompts and all three term groups for terminology metrics.

Pairwise supports may differ; NA = unavailable or constant. All-NA success-rate metrics are omitted. Descriptive model-level correlations, not per-translation correlations or significance tests.
