Language Correlations | JRC Definitions | luna | Zero Shot | Pearson

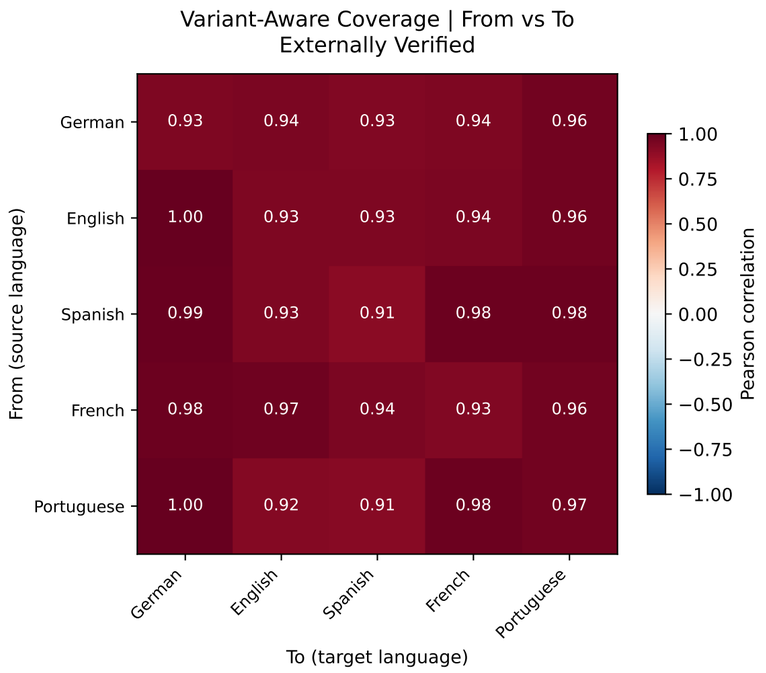

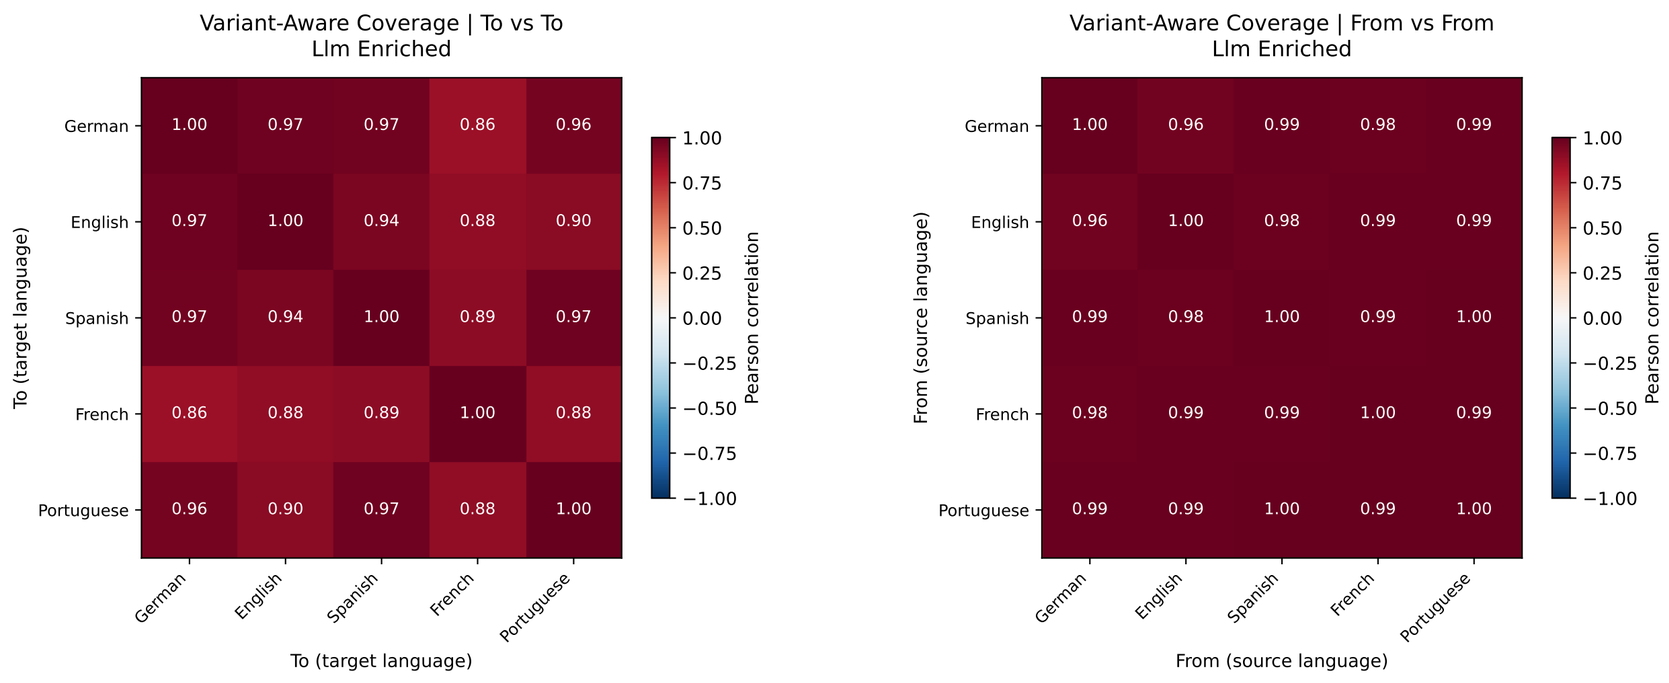

One observation = one of 7 models. Each language score averages its supported partner directions equally within that model.
To = translate into a language; From = translate out of a language. Cross-role panel: rows = From; columns = To.
Partner sets may differ between languages. Native metrics, prompts and datasets are separate; NA = constant or fewer than three models.
Correlations may reflect overall model strength, not isolated language ability. No significance or causal claims.
