One observation = one matched dataset/model/direction score row, not a model mean or an individual translation. Each available row has equal weight; no averaging.
All datasets pooled directly; no equal-dataset weighting. All Luna terminology groups are separate columns; pooled associations may reflect dataset differences.
Each prompting setting is separate; no prompt averaging. NA = constant or fewer than 3 observations.
Underlying scores are direction aggregates; row identities across metrics are unverified. Reused models/texts are dependent; descriptive, not significance evidence.
