Prompting-Change Metric Correlations
Every Available Model-Direction Row | No Further Averaging

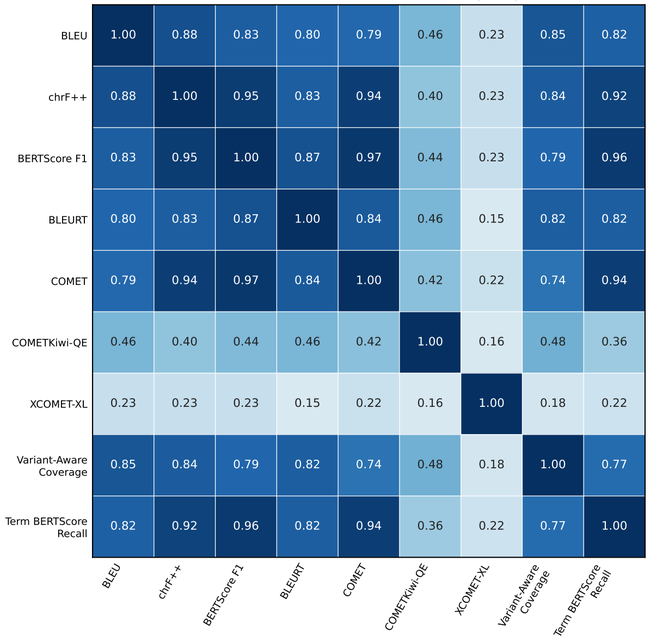

Chemical Patents | Pearson
126-154 model-direction rows per pair

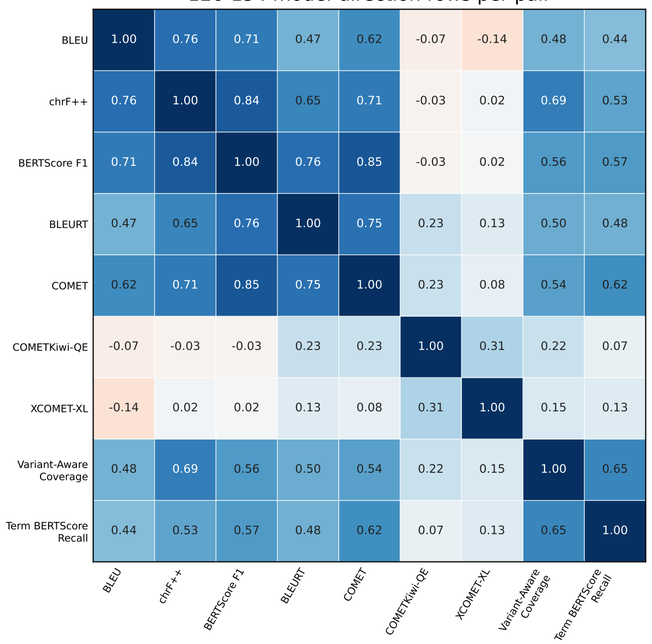

JRC Articles | Pearson
140-140 model-direction rows per pair

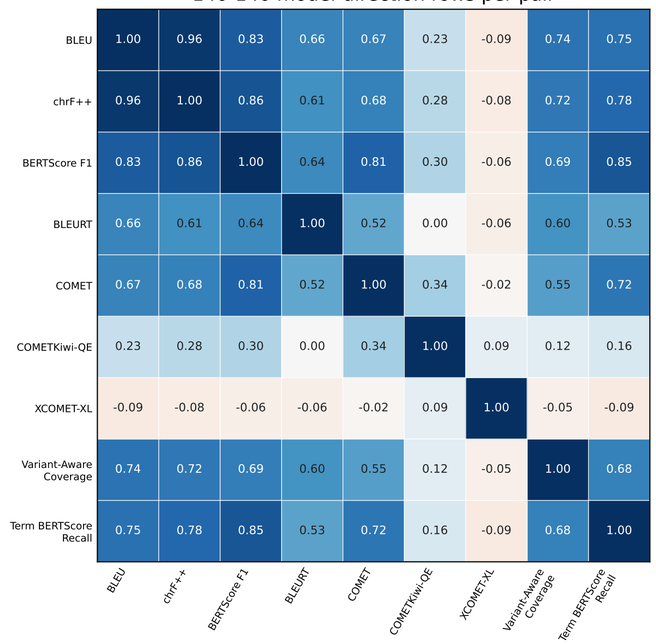

JRC Definitions | Pearson
140-140 model-direction rows per pair

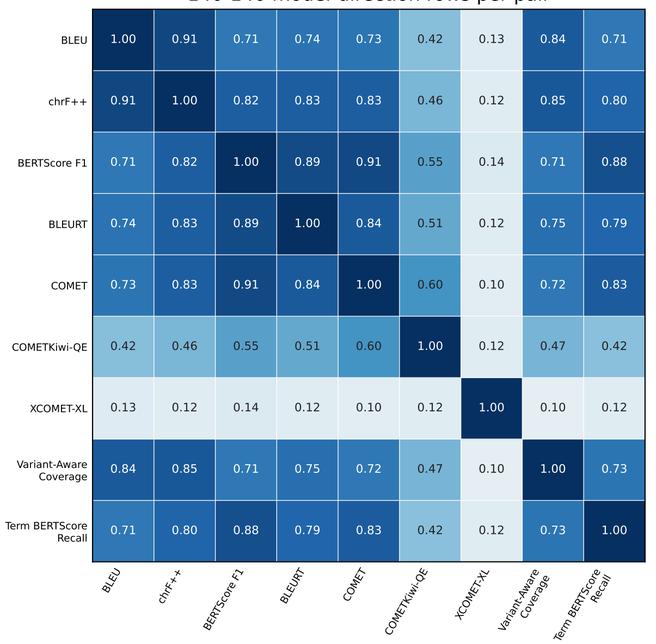

Chemical Patents | Spearman
126-154 model-direction rows per pair

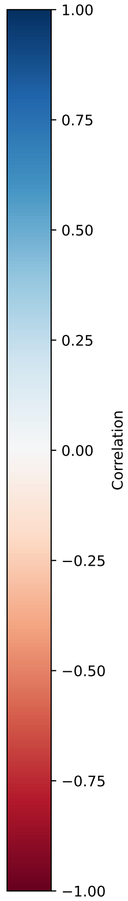

JRC Articles | Spearman
140-140 model-direction rows per pair

JRC Definitions | Spearman
140-140 model-direction rows per pair

One observation = one matched dataset/model/direction score row, not a model mean or an individual translation. Each available row has equal weight; no averaging.
Datasets separate; shared general metrics and Luna LLM-enriched terminology. Metric pairs use their own finite matched-row support.
Changes = few-shot minus zero-shot within each matched model-direction row, requiring both metrics and both prompts. NA = constant or fewer than 3 observations.
Underlying scores are direction aggregates; row identities across metrics are unverified. Reused models/texts are dependent; descriptive, not significance evidence.
